# An alternative to gradient descent

## → Normal equation

- Only for linear regression
- Solve for  $w$ ,  $b$  without iterations

### Disadvantages

- Doesn't generalize to other learning algorithms.
- Slow when number of features is large ( $> 10,000$ )

### What you need to know

- Normal equation method may be used in machine learning libraries that implement linear regression.
- Gradient descent is the recommended method for finding parameters  $w, b$

## Checking Gradient Descent for Convergence

# Gradient descent

$$\begin{cases} w_j = w_j - \alpha \frac{\partial}{\partial w_j} J(\vec{w}, b) \\ b = b - \alpha \frac{\partial}{\partial b} J(\vec{w}, b) \end{cases}$$

# Make sure gradient descent is working correctly

objective:  $\min_{\vec{w}, b} J(\vec{w}, b)$   $J(\vec{w}, b)$  should **decrease** after every iteration

Automatic convergence test

Let  $\epsilon$  "epsilon" be  $10^{-3}$ .  
**0.001**

If  $J(\vec{w}, b)$  decreases by  $\leq \epsilon$  in one iteration,  
declare **convergence**.

(found parameters  $\vec{w}, b$  to get close to global minimum)

## Choosing the Learning Rate

# Identify problem with gradient descent

or learning rate is too large

$$w_1 = w_1 + \alpha d_1$$

use a minus sign

$$w_1 = w_1 - \alpha d_1$$

## Adjust learning rate

With a small enough  $\alpha$ ,  $J(\vec{w}, b)$  should **decrease** on every iteration

If  $\alpha$  is too small, gradient descent takes a lot more iterations to **converge**

Values of  $\alpha$  to try:

... 0.001 0.003 0.01 0.03 0.1 0.3 1 ...  
           $\nearrow$         $\nearrow$         $\nearrow$         $\nearrow$         $\nearrow$         $\nearrow$
